

PROJECT ASSIGNMENTS

1. Create a JavaFX client that consumes all four REST API endpoints from your Spring boot web application. (I1, I2, I3)
2. Create a Mule flow that consumes all four REST API endpoints from your Spring boot web application, and each request and response needs to be saved to a textual file. (I4)
3. Each received and sent request should be integrated with ActiveMQ server and save or receive a message for each request. (I5, I6)
4. Create a jBPM business process that contains all activities included in Spring boot application. (I7)
5. Integrate the service tasks with REST API calls that consume REST API endpoints on the Spring backend, display JSON file in the console, and use it in the process. (I8)
